What we Figure out today:

- The Stuff Log-in System can work successfully
- Navigation, change the output to an Arraylist to show the shortest path between the start vertex and end vertex. So it can be used to draw the line on the map easier.
- We fixed the Database connection problem, but implementing the network on the main thread made the program lag a lot, so we decided to move the connection to other threads to release the pressure of the main thread.
- We decided to add some functions to the employee control system like adding a showcase on the map (database as well). We decided to have another activity to implement the employee work.
- Search Bar connected to the database and can search Items from the database
